

Project Report Guidelines

A strong project report demonstrates not only your technical skills but also your ability to communicate **business insights** clearly. A good data scientist explains results in a way that both technical and non-technical stakeholders can understand.

The Project Report is where you translate technical findings into **meaningful business outcomes**. It is not just about showing code or outputs - it is about **storytelling with data**.

Project Submissions - Expectations:

For every project, you are expected to submit **two files**:

1. **Project Report (PDF format),**
2. **Python Notebook (converted to HTML format).**

Both files are mandatory. Your submission will be graded primarily on the **Project Report**, while the Jupyter Notebook will be used for verification of the results and code execution.

Interim Submission:

The **Interim Submission** should include the following sections in the report:

- Data Overview
- Exploratory Data Analysis
- Data Preprocessing
- Model Building

Final Submission:

The **Final Submission** should include the complete report with the following sections:

- Data Overview
- Exploratory Data Analysis
- Data Preprocessing
- Model Building
- Transfer Learning
- Model Deployment
- Actionable Insights and Recommendations

What is Expected in a Project Report?

1. Cover all sections in the correct sequence, as per the rubric. Avoid skipping sections.
2. Present a **step-by-step logical approach** to solving the problem, with reasoning behind every step.
3. Support explanations with **tables, graphs, and plots** (e.g., histograms, box plots, bar graphs).
4. Provide a **clear interpretation** of results in simple English that decision-makers can understand.
5. Include **Business Insights and Recommendations** to connect findings back to the business context.

What an Inadequate Project Report Looks Like?

1. Filled with **Python codes** and little to no explanation or interpretation.

2. Contains **one-line answers** without logic, insights, or explanations.
3. Directly exporting a **Jupyter Notebook as a PDF** and submitting it as the report.

Dos for Project Report

- Follow all guidelines provided by the Program Office.
- Keep the report professional and concise (ideally within **25 pages**).
- Place all **raw codes and raw outputs** in the Appendix, not in the main body.
- Present **EDA results in a clean tabular form** for clarity and comparison.
- Ensure **tables, figures, and charts are properly labeled** with legible axis labels, legends, and titles.
- Show **all numbers up to 2 decimal places** (unless otherwise required).
- Provide a **final section of Actionable Insights & Recommendations**.
- Use Appendices for supplementary material (raw code, extended tables, additional plots).
- Maintain **professional formatting** with numbered pages, properly captioned visuals, and consistent style.

Don'ts for Project Report

- Do not rely only on **visualizations without modeling** - a project must have predictive modeling.
- Do not fill the main body of the report with **raw code or outputs**.
- Do not copy-paste unreadable tables or chart snapshots directly from Python outputs.
- Do not use **non-standard abbreviations or acronyms** without explanation.
- Do not submit incomplete reports or skip sections mentioned in the rubric.
